

Type of Databases

Ankit Pangasa

Relational

Each row represents a unique record, each column is a field in the record.

e.g. MySQL, PostgreSQL

Columnar

Stores data by columns.
Optimized for complex analytical
queries over large datasets.

e.g. Google's BigQuery, Apache
Cassandra

SWIPE →

Document

Data is semi-structured and encoded in a format like JSON, BSON or XML.

e.g. MongoDB and Apache CouchDB

Graph

Graph are represented as nodes and relationships as edges. Graph theory is used for storage and queries.

e.g. Neo4j and Amazon Neptune

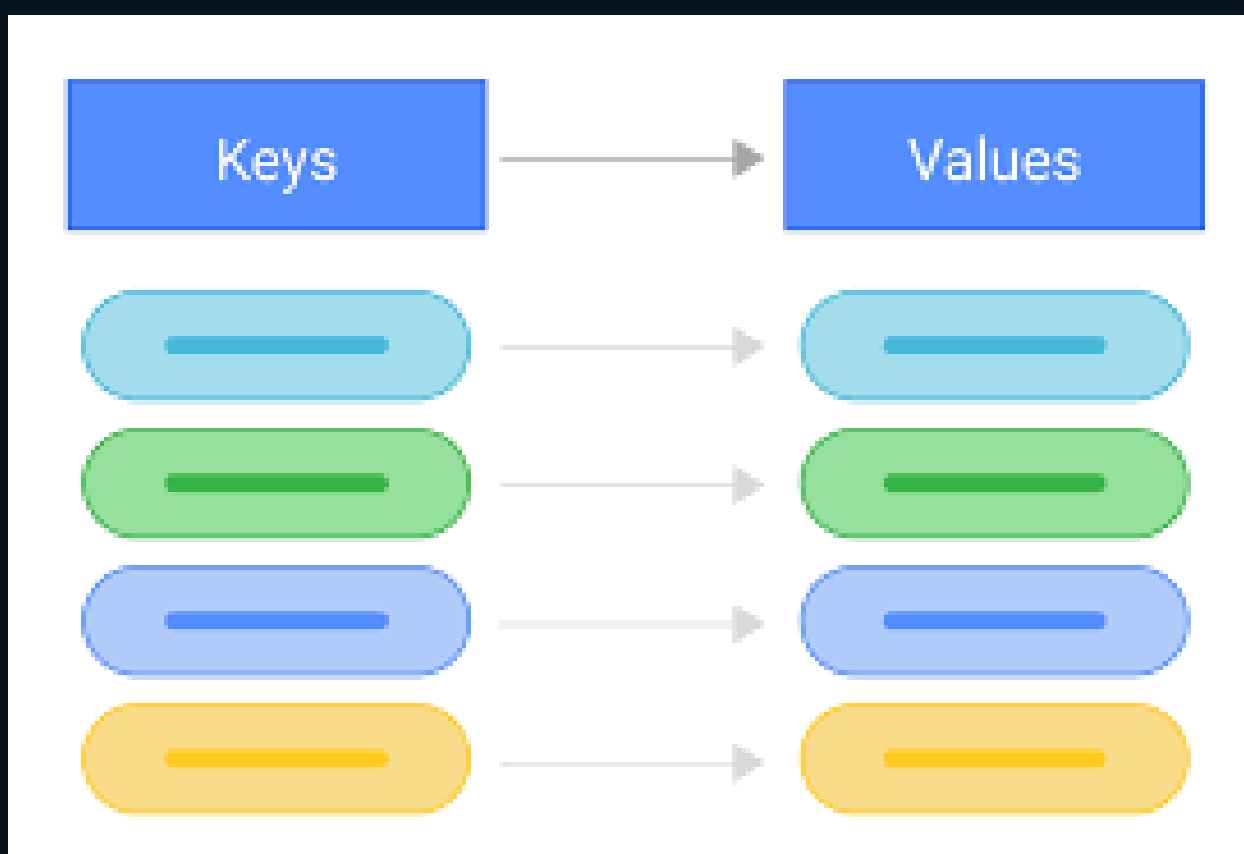

Key-value

Each value in database is associated with a unique key.

e.g. Redis and Amazon DynamoDB

Time-series

Optimized for time-stamped data,
usually comes with built-in time-
based functions.

e.g. InfluxDB and TimescaleDB
